## FOREWORD

This is the final report submitted in fulfillment of Contract F04611-67-C-0019. The program had two Air Force Project Engineers, Lt. James D. Cox/RPRRC and, later, Capt. J. F. Ensminger/RPRRC. Volume I of this report contains the background, development, and critique of the Sensitive Time Lag Theory of combustion instability, a description of the computer program that is used to provide a solution of the analytical model, and the use of the model in the analysis and design of liquid rocket engines based on empirical correlations. Volume II contains the flowcharts and listings of the computer program. Therefore, Volume I is referred to as the Engineer's Handbook while Volume II is referred to as the Programmer's Handbook.

The contract effort was conducted by the Thrust Chamber Engineering Division of Liquid Rocket Operations under Dr. C. B. McGough, Program Manager; Dr. R. J. Hefner and, during the final phases of the contract, by Mr. J. M. McBride, Project Managers; Mr. A. J. Smith, Jr., Project Engineer; Dr. F. H. Reardon, of Sacramento State College, and Dr. L. M. Crocco, Dr. W. A. Sirignano, and Mr. D. T. Harrje, of Princeton University, Consultants. This report has been prepared in accordance with MIL-STD-847 (USAF) dated 25 February 1965. The period of this report is 2 September 1966 through 31 November 1967.

It is essential to give special acknowledgement to Dr. L. M. Crocco, originator of the Sensitive Time Lag Theory, and his co-workers whose individual contributions to this dissertation are reflected throughout. In addition to contributing significant portions of the Background, Theory, and Conclusion sections, as well as Appendices I through III, they have reviewed the entire text and have made many helpful suggestions during the entire course of the contract.

This technical report has been reviewed and is approved.

Capt. J. F. Ensminger  
USAF Project Engineer

## ABSTRACT

The main objective of this report is to include, under one cover, all of the work concerned with the development of the Sensitive Time Lag Theory of liquid rocket engine combustion instability. This work includes all the aspects of the theory from the mathematical formulation of the analytical model to the application of the model to actual engine problems. The initial section of the report reviews the logical considerations of the instability phenomenon and relates how the time lag concept conforms analytically as well as experimentally to the problem. Thereafter, the mathematics of the model are developed with the major emphasis placed on the linearized model; however, various aspects of the nonlinear model are also discussed. The mathematical analysis gives rise to a computer program, which is presented in Volume I in the form of an Engineer's instruction manual and in Volume II in the form of a detailed description for the Programmer. The report then focuses its attention on the designer and instructs him in not only how to use the model in practical situations but also how to interpret and correlate test data. The main body of the text concludes with a critique of the time lag concept and outlines the kind of research that is needed in order to improve the time lag model.

13. ABSTRACT The main objective of this report is to include, under one cover, all of the work concerned with the development of the Sensitive Time Lag Theory of liquid rocket engine combustion instability. This work includes all the aspects of the theory from the mathematical formulation of the analytical model to the application of the model to actual engine problems. The initial section of the report reviews the logical considerations of the instability phenomenon and relates how the time lag concept conforms analytically as well as experimentally to the problem. Thereafter, the mathematics of the model are developed with the major emphasis placed on the linearized model; however, various aspects of the nonlinear model are also discussed. The mathematical analysis gives rise to a computer program, which is presented in Volume I in the form of an Engineer's instruction manual and in Volume II in the form of a detailed description for the Programmer. The report then focuses its attention on the designer and instructs him in not only how to use the model in practical situations but also how to interpret and correlate test data. The main body of the text concludes with a critique of the time lag concept and outlines the kind of research that is needed in order to improve the time lag model.
